PEER TO PEER CABLE TERMINATION REPORT

AMPUMUZA ESTHER, LIGIWA GABRIEL

June 2026

1 Introduction

This report explains the practical activity carried out in class on file sharing between two personal computers (PCs) using an Ethernet cable. The practical was aimed at understanding how computers communicate in a local area Network (LAN) and how files can be transferred directly from one computer to another through a wired connection.

2 Materials used

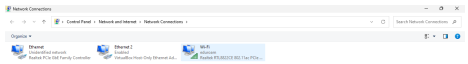

The following materials and equipment were used during the practical session:

Two personal computers (PCs)
Ethernet cable (UTP cable)
RJ45 connectors
Shared files and folders

3 Procedure

Step 1: Connecting the Two PCs

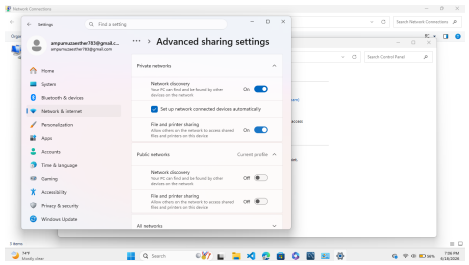

The two computers were connected directly using an Ethernet cable through their network ports.

Step 2: Configuring IP Addresses

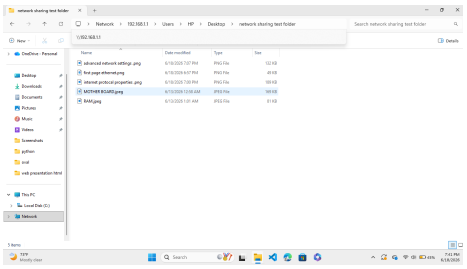

Static IP addresses were assigned to both PCs to allow communication.
Example Configuration PC 1
IP Address: 192.168.1.1
Subnet Mask: 255.255.255.0
PC 2
IP Address: 192.168.1.2
Subnet Mask: 255.255.255.0
Both computers were configured within the same network range. Step 3:

Testing Connectivity
The connection between the computers was tested using the "ping" command through the Command Prompt.
Example:
ping 192.168.1.2
Successful replies confirmed that the computers were communicating properly.
Step 4: Enabling File Sharing
The following steps were followed:
Network discovery was turned on.
File and printer sharing was enabled.
A folder was selected and shared on PC 1.
Permissions were granted to allow access from PC 2.
Step 5: Accessing Shared Files
From PC 2, the shared folder was accessed through the network section or by typing the IP address of PC 1 in the File Explorer.
Example:
192.168.1.1
Files were successfully opened, copied, and transferred between the two computers.

4 Observation

The Ethernet cable provided a stable and fast connection between the two PCs.
Proper IP address configuration was necessary for successful communication.
Shared folders became accessible after enabling file sharing settings.
File transfer was completed successfully without internet access.

5 Advantages

Fast data transfer speed.

Reliable and stable connection.

Does not require internet access.

Low cost and easy to set up.

6 Conclusion

The practical session successfully demonstrated how files can be shared between two PCs using an Ethernet cable. Students learned how to connect computers, configure network settings, enable file sharing, and transfer files within a local area network. The activity improved practical networking skills and understanding of computer communication systems.
